

introduction

01

the brief

bridging the gap between ideas and execution

context/prompt

- Digital interfaces must prioritize intuitive, accessible design — because great functionality alone isn't enough if the experience fails to resonate with real users.

bridging the gap (between what?)

- Most people who care about design can't build what they imagine
- Figma is powerful — but it assumes you already think like a designer
- The tools have never met people where they are
- We asked: what if the interface spoke human?

solution

make soulful design accessible to anyone with an idea

fun, easy, and soulful design

- Tactile is a Figma plugin that lets you design with your hands and your words
- Describe a feeling — warm, bold, academic — and watch it become a real design
- No hex codes. No type scales. Just instinct and intention
- Built for the person who has taste but hasn't had the tools to express it

demo

02

design process

03

research

we looked at what designers & aspiring designers actually care about — and what they wish existed

whats existing & inspo

- Went deep on Figma Makeathon submissions — understood what had been built and where the ceiling was'
- Scrolled X to hear how designers actually talk: what frustrates them, what they repost, what makes them stop
- We weren't just looking for cool & interesting. We were looking for that's useful
- Found the same tension everywhere: accessible tools feel dumbed down, serious tools shut non-designers out
- That gap became our target — something a non-designer picks up in 60 seconds, that a designer still respects

•Untitled•

ideation

we didn't start with features. We started with what already resonated.

coming up with solutions

- Used FigJam to map submissions we genuinely liked — what made them stick and why
- Asked: what works across both audiences? What can a non-designer use that a designer still respects?
- The best submissions had a strong point of view, not just clever tech
- That became our filter: every idea had to have soul before it had a feature list

brand identity

- The sky is the limit today with what is possible for projects, and we wanted to reflect that
- We centered the brand identity around clouds and the sky, since we wanted to build a feeling of limitless potential

rapid prototyping

build fast. Break things. decide early.

creating fast & failing fast

- Started in Figma — lo-fi screens, rough layouts, just enough to see if an idea held up
- Fed those frames directly into Claude and Cursor as context for building
- Each iteration informed the next — design decisions made in Figma showed up as real code within hours
- Failing fast meant we could solidify features early before getting locked into the wrong direction
- The loop was: sketch in Figma → build in Claude + Cursor → break it → go back to Figma

iteration

every version taught us something the last one couldn't

lo-fi screens

- Lo-fi screens showed us layout before we got attached to aesthetics
- Cursor and Claude helped us move from concept to working code in hours not days
- The gesture map went through four complete rewrites — open palm, finger counting, then finally distinct shapes
- We kept asking: does this feel like Tactile, or does it feel like a tool?

features

Hand Gestures

- Point: Cursor mode; hover/select.
- Pinch: Click/select.
- Peace: Scroll mode in style editor.
- Thumbs up: Toggle style editor (short hold).
- Open palm: Drag frame when hand is over it.
- Rock / Horns: Hold to delete frame.
- Two palms: Create/pull frame.
- Two peace signs: Resize by hand spread

implementation

what is the problem we're facing?

features & stack

purpose & outcome

04

outcome

we closed a gap we felt personally

what we learned

Our team learned the importance of communication while building a vision. We needed to coordinate our frontend, backend, design, integration, and etc. Everything fell into place after we had deep discussions about the purpose of our project and the impact we were trying to make.

bridging the gap

- Tactile proved that abstract language can drive real design decisions
- The hardest part wasn't the tech — it was deciding what to cut
- We learned that constraints are what give something soul
- Design isn't about the tools. It's about giving people the confidence to decide.
- "We want to let people decide."
