Emerson University Recruiting
Software Engineering Intern
Process automation software — tools, diagnostics, and utilities

Dear Emerson Recruiting Team,

I am applying for the Software Engineering Intern role focused on tools that simplify day-to-day problem solving. I am a Computer Science major at the University of Texas at Dallas (expected May 2028, GPA 3.5), entering my upper-division years, and I am legally authorized to work in the United States without sponsorship. I want to build the applications, diagnostics, and utilities that make complex software investigations faster and clearer—not just features that look finished, but tools people actually reach for when something breaks.

What draws me to Emerson is process automation done seriously: systems that keep critical industries safer and more reliable. I already know that world from the partner side. For two summers I interned at Vinson Process Controls, an Emerson Impact Partner, building React and Node.js tools for an edge-computing RTU. The work was software troubleshooting in practice—surfacing equipment faults before downtime—and a shortcut overview that improved operator efficiency by 1200% by applying technology to a business problem operators hit every shift. We shipped through Docker and CI/CD so investigations and releases stayed reproducible. Returning for a second term taught me how Emerson-aligned process automation teams expect ownership, clear communication, and tools that respect the people who use them.

That same pattern shows up elsewhere. At Codeaify I used Python and SQL to replace manual handling of sensitive data with guardrails and encryption, then raised automated test coverage to 95% so defects were caught before clients paid for them. At JPMorgan Chase I turned Cassandra metrics into a reporting view that doubled actionable insight and walked 15+ managers through the findings. Those roles taught me to separate noise from signal, report results, and connect a technical fix to an outcome someone else can act on.

I am looking for a team where problem solving means envisioning a better way to complete a task—higher efficiency, better user experience, and technology applied to real business problems with measurable results. I would be glad to bring that mindset back into the Emerson ecosystem, this time building the development tools and diagnostics that help engineers investigate and improve the platforms customers rely on.

Thank you for your time. I would welcome the chance to contribute.

Sincerely,
Prabhas Gade
